Summative

Why did I chose Accommodation

I chose this option because I felt more comfortable, and confident to start off with. The pictures below are what I used to set up my pages, and its based on a Auckland Accomodation for those who are really need a place to stay.

I tried to simplify this and make it simple for those who have a hard time using the internet also make the website look more attractive so it looks more promising for the users eyes.

I started this when the assignment started: 21/11/2022.

The logo for Booking.com, featuring the text "Booking.com" in white on a dark blue background.

STORIES FROM

The Hilton logo, consisting of the word "Hilton" in a bold, serif font, enclosed within a black rectangular border.

Errors

Error 1: filters, for some reason filters was pretty hard for me to pull off at first, There are times where it works for some and not all. I had to relook at my code if i have anything missing.

Error 2: Checkbox modal pricing

It took me awhile to find out why they gave me a NAN, it was because I had to use a Parseint and give my checkbox a data-id, so it took me a while to fix. But after finding out I finally learnt from my mistakes.

How did I manage to get this done?

There are times where I had to take a break and I kept over working on my project, which is something you should never do, taking a break is much more better from what I learnt.

So there are some days where i just non-stop do this project every single day while I have work at the same time and exercise. So I manage to balance it out by just making notes for myself to finish each task to do

Example: Make animation for modals, Add styling for each text

And background colour. Read guidelines and follow up

Things like that.

Feedbacks

I asked feedbacks from classmates and my tutor. As my tutor said your design needs more improvement, So I decided to change a lot of things and use google fonts, and style a lot of things on the website, and also colour palette. As I showed my site to a few people some people said it looks good. But I think if i were to improve, I would have to take a lot of javascript practice and take it seriously in the future.

Although feedbacks were positive.

What function did I have to give up on?

I had to really give up on like validating the date entered and amount of people entered, because it wasn't working, tried so many ways to make it work but it kept giving me errors. The only thing I had to fake the validation, so even if its entered or not the contents of the places will show.

Although that was what made everything faster in the end.

Site still works perfectly.
